

QuickChat

QuickChat is a chat website that automatically sends your messages 5 seconds after you begin typing. No longer must you wait for slow-typing and long-winded friends -- you will be forced to have short and to-the-point conversations.

Team

I want to work in a team of 4. Ben, Jordan, and Tomy have agreed to join the group.

SQL

Don't care which relational database we use -- MySQL, PostgreSQL or a different one. Open to suggestions.

NoSQL

I am leaning towards a document database such as MongoDB.

Business

We will follow the Silicon Valley strategy of growing fast and worrying about monetization after we've achieved scale. After the website grows to a million daily users, we will reach out to advertisers and influencers on other platforms, and convince them to come use QuickChat as their exclusive social platform.

Legal

The business will be a Utah LLC.

Technical

Our technical priorities are:

- Choose which databases to use for both SQL and NoSQL implementations
- Select client and server side programming languages, based on what the team is comfortable and proficient using
- Build a minimum viable product and use it to start searching for early adopters
